

# REDCapSync: Encapsulated REDCap projects for pipelines, functions, and applications in R

by Brandon Rose and Natalie Goulett

**Abstract** Many R packages exist for working with the various API endpoints but none have been established for an encapsulated “get-everything” work flow that produces a standardized R object. REDCapSync accomplishes this and can serve as a dynamic input object for downstream functions.

## 1 Abstract

- Brief description of REDCap as a dominant data capture platform in clinical research
- Limitations of existing R packages interfacing with the REDCap API
- Introduction of *REDCapSync* as an encapsulated, state-aware representation of REDCap projects in R
- Key contributions:
  - Project-level encapsulation of metadata and data
  - Incremental synchronization rather than full re-downloads
  - Export of structured, audit-friendly Excel workbooks with advanced features (e.g., deidentification)
  - Designed for pipelines, analysis functions, and Shiny applications
- Summary of current capabilities and future roadmap (bi-directional sync)

## 2 Introduction

Some REDCap API packages include [REDCapR](#), [redcapAPI](#), [tidyREDCap](#)...

One of the reasons people do not choose more complicated structures in REDCap, such as repeating instruments is the data exports require a manual or automated process to merge the data into a usable format. For example if you have non-repeating data in one form...

Enter REDCapSync ...

**Figure 1:** REDCapSync: Encapsulated REDCap projects for pipelines, functions, and applications in R

## 2.1 REDCap in Clinical and Translational Research

- Widespread use of REDCap for:
  - Clinical trials
  - Observational cohorts
  - Registries and quality improvement
- Strengths of REDCap (governance, compliance, structured metadata)
- Common downstream needs in R:
  - Analysis pipelines
  - Reporting
  - Visualization and applications

## 2.2 The Gap Between REDCap and R Pipelines

- Typical REDCap-to-R workflows:
  - Stateless API pulls
  - Flat data frames
  - Manual post-processing
- Consequences:
  - Redundant API calls
  - Loss of project structure
  - Fragile downstream code
  - Poor support for reproducibility and automation

## 3 Key Design Choices

- No API token stored anywhere except user-defined renviro, not in cache, project object, global environment, or code.
- deidentify Excel outputs by default

## 4 Hypothetical

You are working on a research project collecting surveys from hundreds of participants. You are writing code that makes a visual.

## 5 Who is REDCapSync for?

## 6 Related Work and Limitations of Existing Packages

### 6.1 Existing REDCap R Packages

- API wrappers

- Data-frame-oriented imports
- Metadata access utilities

## 6.2 Common Design Pattern: Stateless Data Access

- Existing tools primarily:
  - Fetch data on demand
  - Return tables or lists
  - Leave project structure implicit
- Lack of:
  - Encapsulation
  - Persistent project state
  - Awareness of prior syncs

## 6.3 Why Encapsulation Matters

- Contrast with object-oriented or stateful designs in:
  - Database interfaces
  - Data pipelines
  - ETL frameworks
- Motivation for a higher-level abstraction representing a **REDCap project as an object**

# 7 Design Philosophy of REDCapSync

## 7.1 Encapsulated REDCap Projects

- Core concept: a REDCap project is represented as a **single structured R object**
- Encapsulation of:
  - Project metadata
  - Instruments and fields
  - Records and events
  - Sync state and provenance

## 7.2 Separation of Concerns

- Clear distinction between:
  - Data retrieval
  - Transformation
  - Export and downstream usage

- Benefits for:
  - Reproducibility
  - Testing
  - Modularity

### 7.3 Designed for Pipelines, Not Just Data Access

- Object persists across:
  - Scripts
  - Functions
  - Shiny applications
- Enables consistent behavior across contexts

## 8 Incremental Synchronization

### 8.1 Motivation

- Large projects and frequent data updates
- Inefficiency of full data re-downloads

### 8.2 Selective Updating

- REDCapSync tracks:
  - What has already been retrieved
  - Which components need refreshing
- Supports:
  - Metadata-only updates
  - Data-only updates
  - Targeted form or event updates

### 8.3 Benefits

- Reduced API load
- Faster iteration
- Improved stability in automated workflows

## 9 Structured Excel Export as a First-Class Feature

### 9.1 Excel as an Interoperability Layer

- Excel remains a dominant format for:
  - Clinical teams
  - Data managers
  - Regulatory workflows

### 9.2 Custom Excel Workbooks

- REDCapSync exports:
  - Multiple sheets reflecting project structure
  - Consistent naming and formatting
- Preserves:
  - Metadata context
  - Variable labels
  - Choice mappings

### 9.3 Advanced Features

- Built-in support for:
  - Deidentification strategies
  - Derived fields
  - Project-specific annotations
- Designed for:
  - Review
  - Sharing
  - Archival

## 10 Applications

### 10.1 Clinical Trials

- Ongoing data monitoring
- Interim analyses
- Regulatory-compliant exports

## **10.2 Observational and Registry Studies**

- Longitudinal data handling
- Incremental updates
- Consistent downstream datasets

## **10.3 Shiny Applications and Dashboards**

- Live, synchronized project objects
- Reduced logic duplication
- Stable data interfaces

# **11 Implementation**

## **11.1 Package Architecture**

- Internal object structure
- Use of R lists / classes
- Dependency philosophy

## **11.2 Reproducibility and Transparency**

- Explicit sync steps
- Inspectable internal state
- Alignment with reproducible research practices

# **12 Comparison with Existing Approaches**

## **12.1 Feature Comparison**

- Stateless API wrappers vs REDCapSync
- Encapsulation
- Incremental sync
- Structured Excel export
- Pipeline integration

## **12.2 When to Use REDCapSync**

- Not a replacement for all REDCap tools
- Best suited for:

- Long-lived projects
- Repeated analyses
- Applications and automated pipelines

## 13 Future Directions

### 13.1 Bi-Directional Synchronization

- Uploading data from previously exported Excel workbooks
- Validation against metadata
- Controlled updates back to REDCap

### 13.2 Extended Deidentification and Governance Features

- Project-level policies
- Role-based exports

### 13.3 Ecosystem Integration

- Downstream analysis packages
- Shiny app wrappers
- File-system-based project organization

## 14 Conclusion

- REDCapSync introduces a new abstraction for working with REDCap in R
- Encapsulation enables:
  - More robust pipelines
  - Better reproducibility
  - Reduced cognitive and technical overhead
- Positions REDCap projects as durable, inspectable R objects rather than transient API responses
